Configure VM Settings

Start the virtual machine

Login as root, set the system to create new user

Install Guest Additions

Start using your VM

A VirtualBox virtual machine (VM) is essentially a software-defined computer that runs inside your physical computer (the host).

The VM behaves like a separate PC with its own CPU, RAM, storage, network card, and operating system, even though all of these are virtualized by VirtualBox

The guest operating system is the OS installed inside the virtual machine (e.g., Arch Linux).

It has its own kernel, filesystem, applications, and processes, isolated from the host. Though it still shares the host's physical RAM, CPU, and disk I/O.

To the guest, the virtual hardware appears to be a normal physical computer.

Start the virtual machine

Login as root, set the system to create new user

Install Guest Additions

Start using your VM

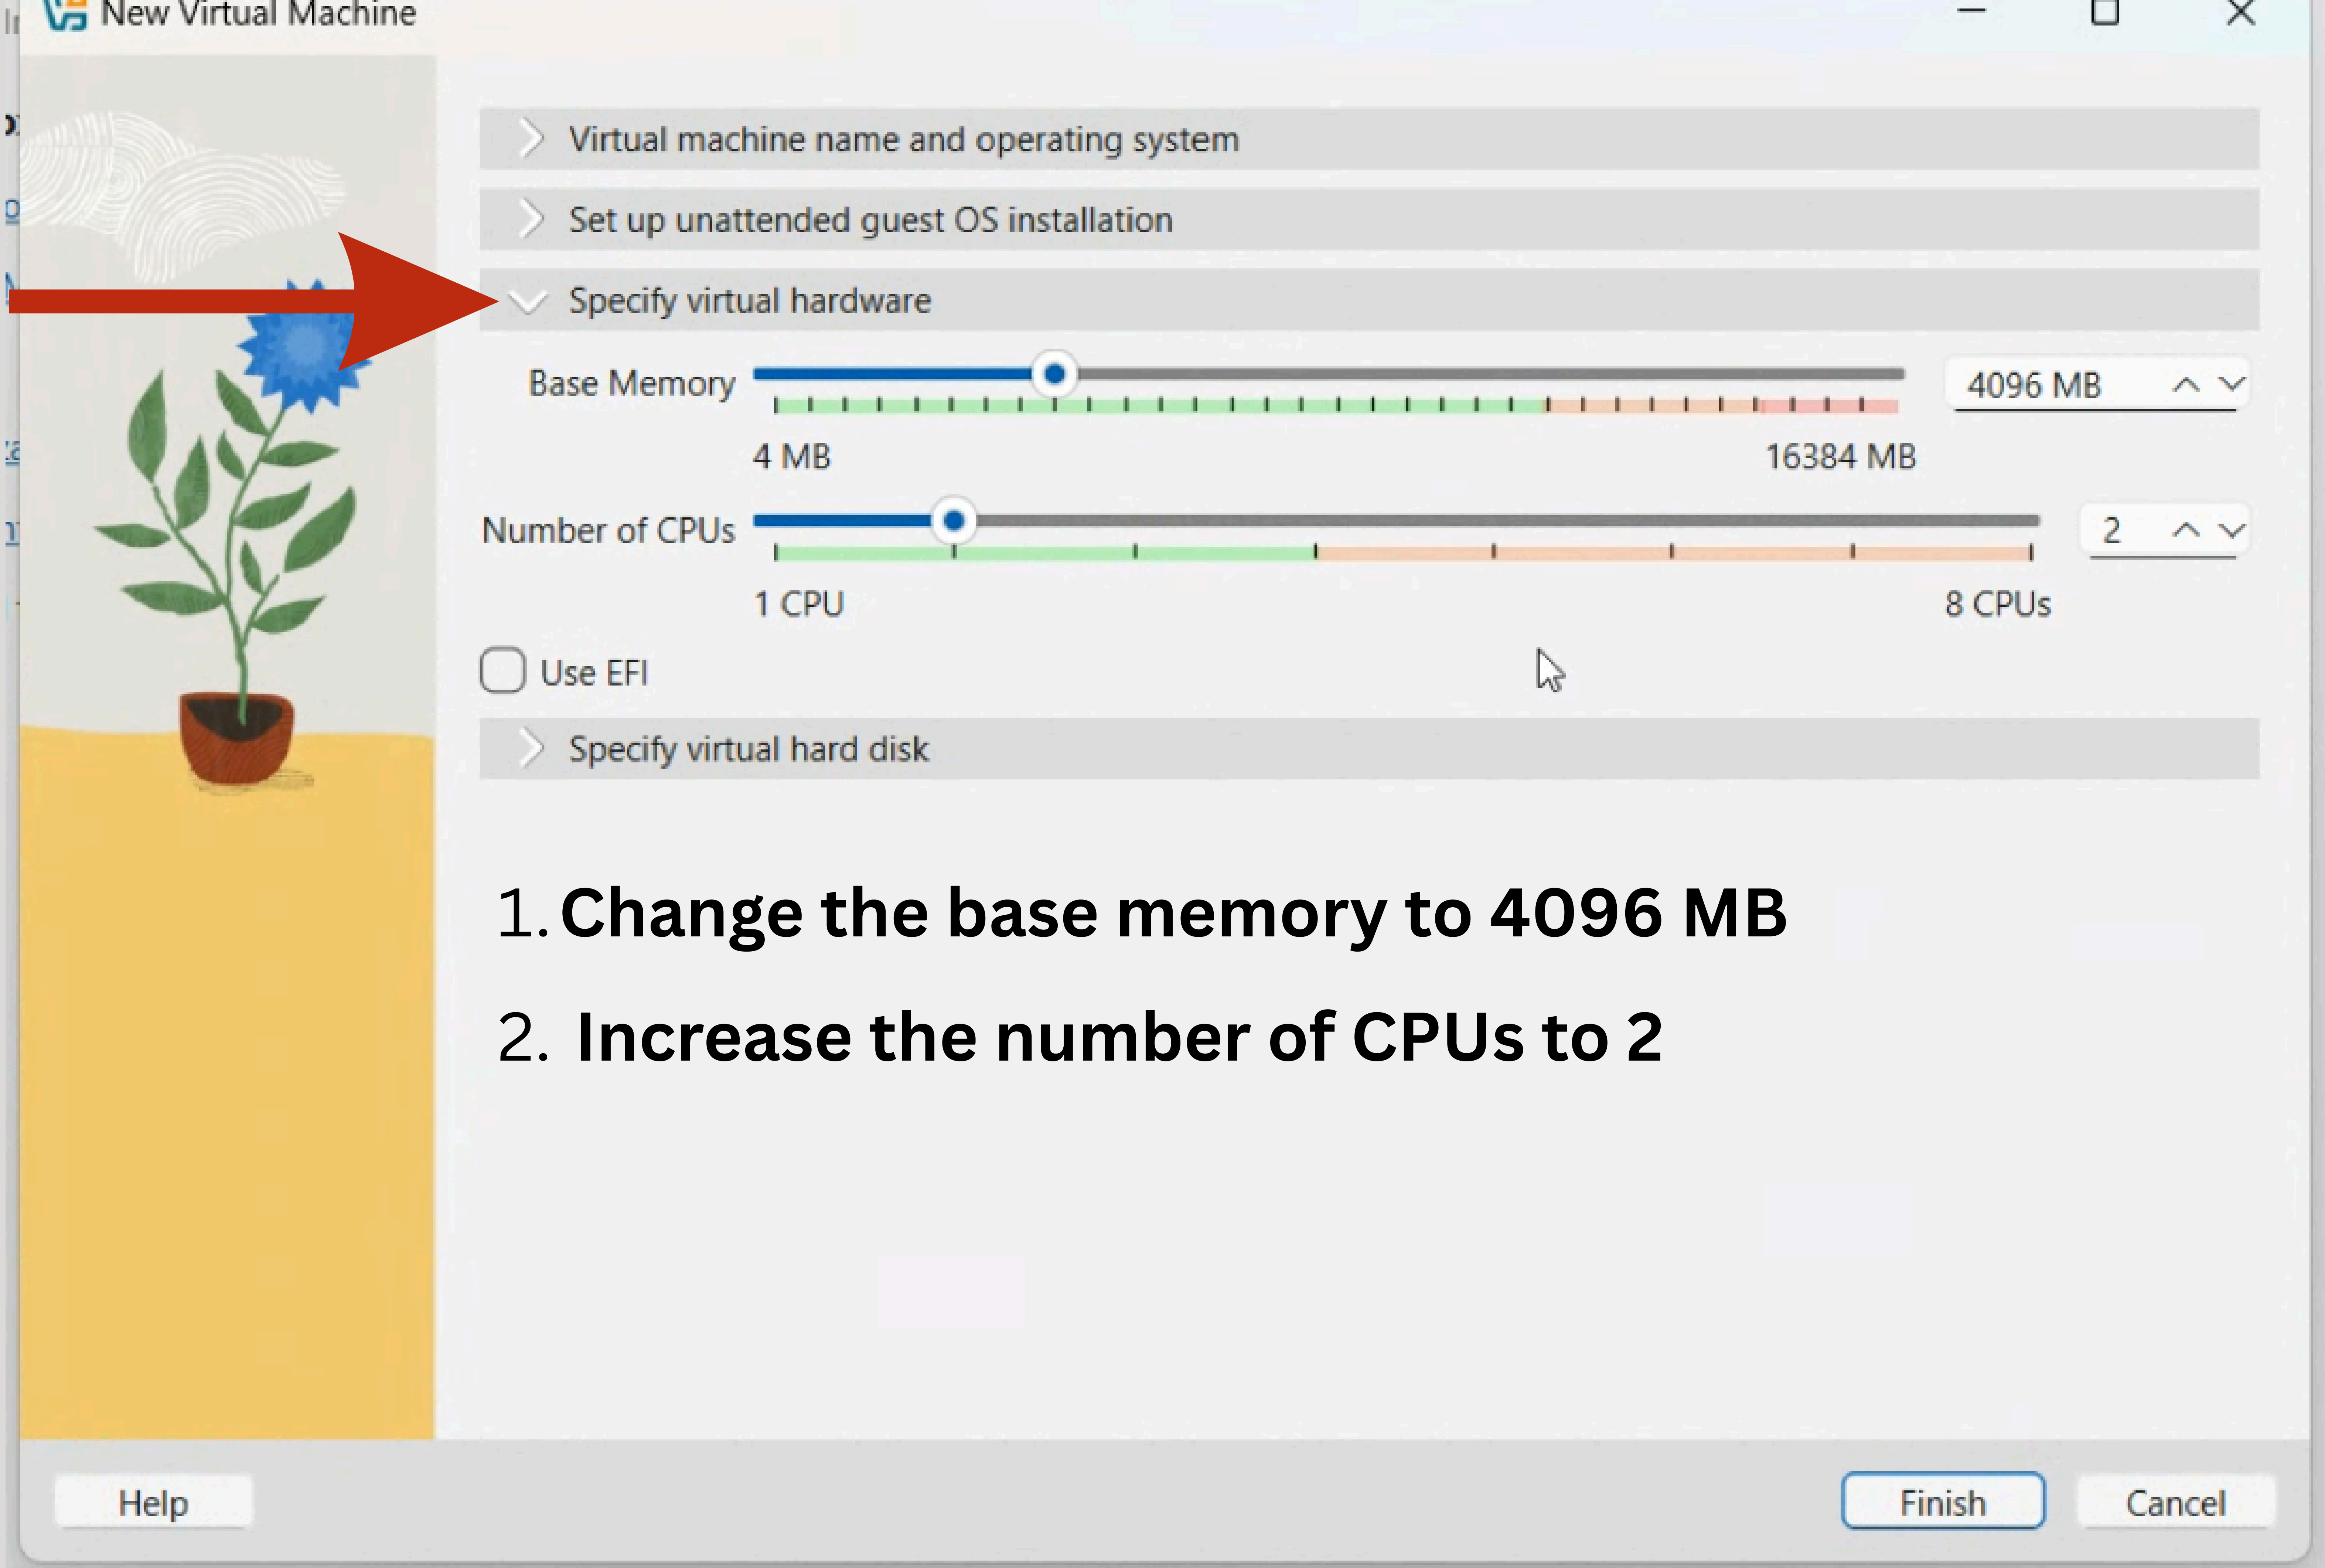
1. **Name your virtual machine**

2. **Select the folder where your VirtualBoxVMs is**



1. **Change the base memory to 4096 MB**
2. **Increase the number of CPUs to 2**

runasroot.sh  VBoxSolarisAdditions.pkg
[adam@maya VBox_GAs_7.2.12]$ ./
```

sudo stands for “superuser do” (often informally interpreted as do as superuser")

allows a normal user to run a command with administrator/root privileges.

1. sudo pacman -Qs keyring // checks the keyring-related packages
2. sudo pacman -S archlinux-keyring // update the Arch signing keys.
3. sudo pacman -Syu // update the entire system using the refreshed keys

Create new user

1. useradd -m username

// -m creates the user's home directory:

2. passwd username

// set the user's password

Give the user sudo privileges

sudo visudo

// opens the sudo configuration

Scroll down. At the bottom, add:

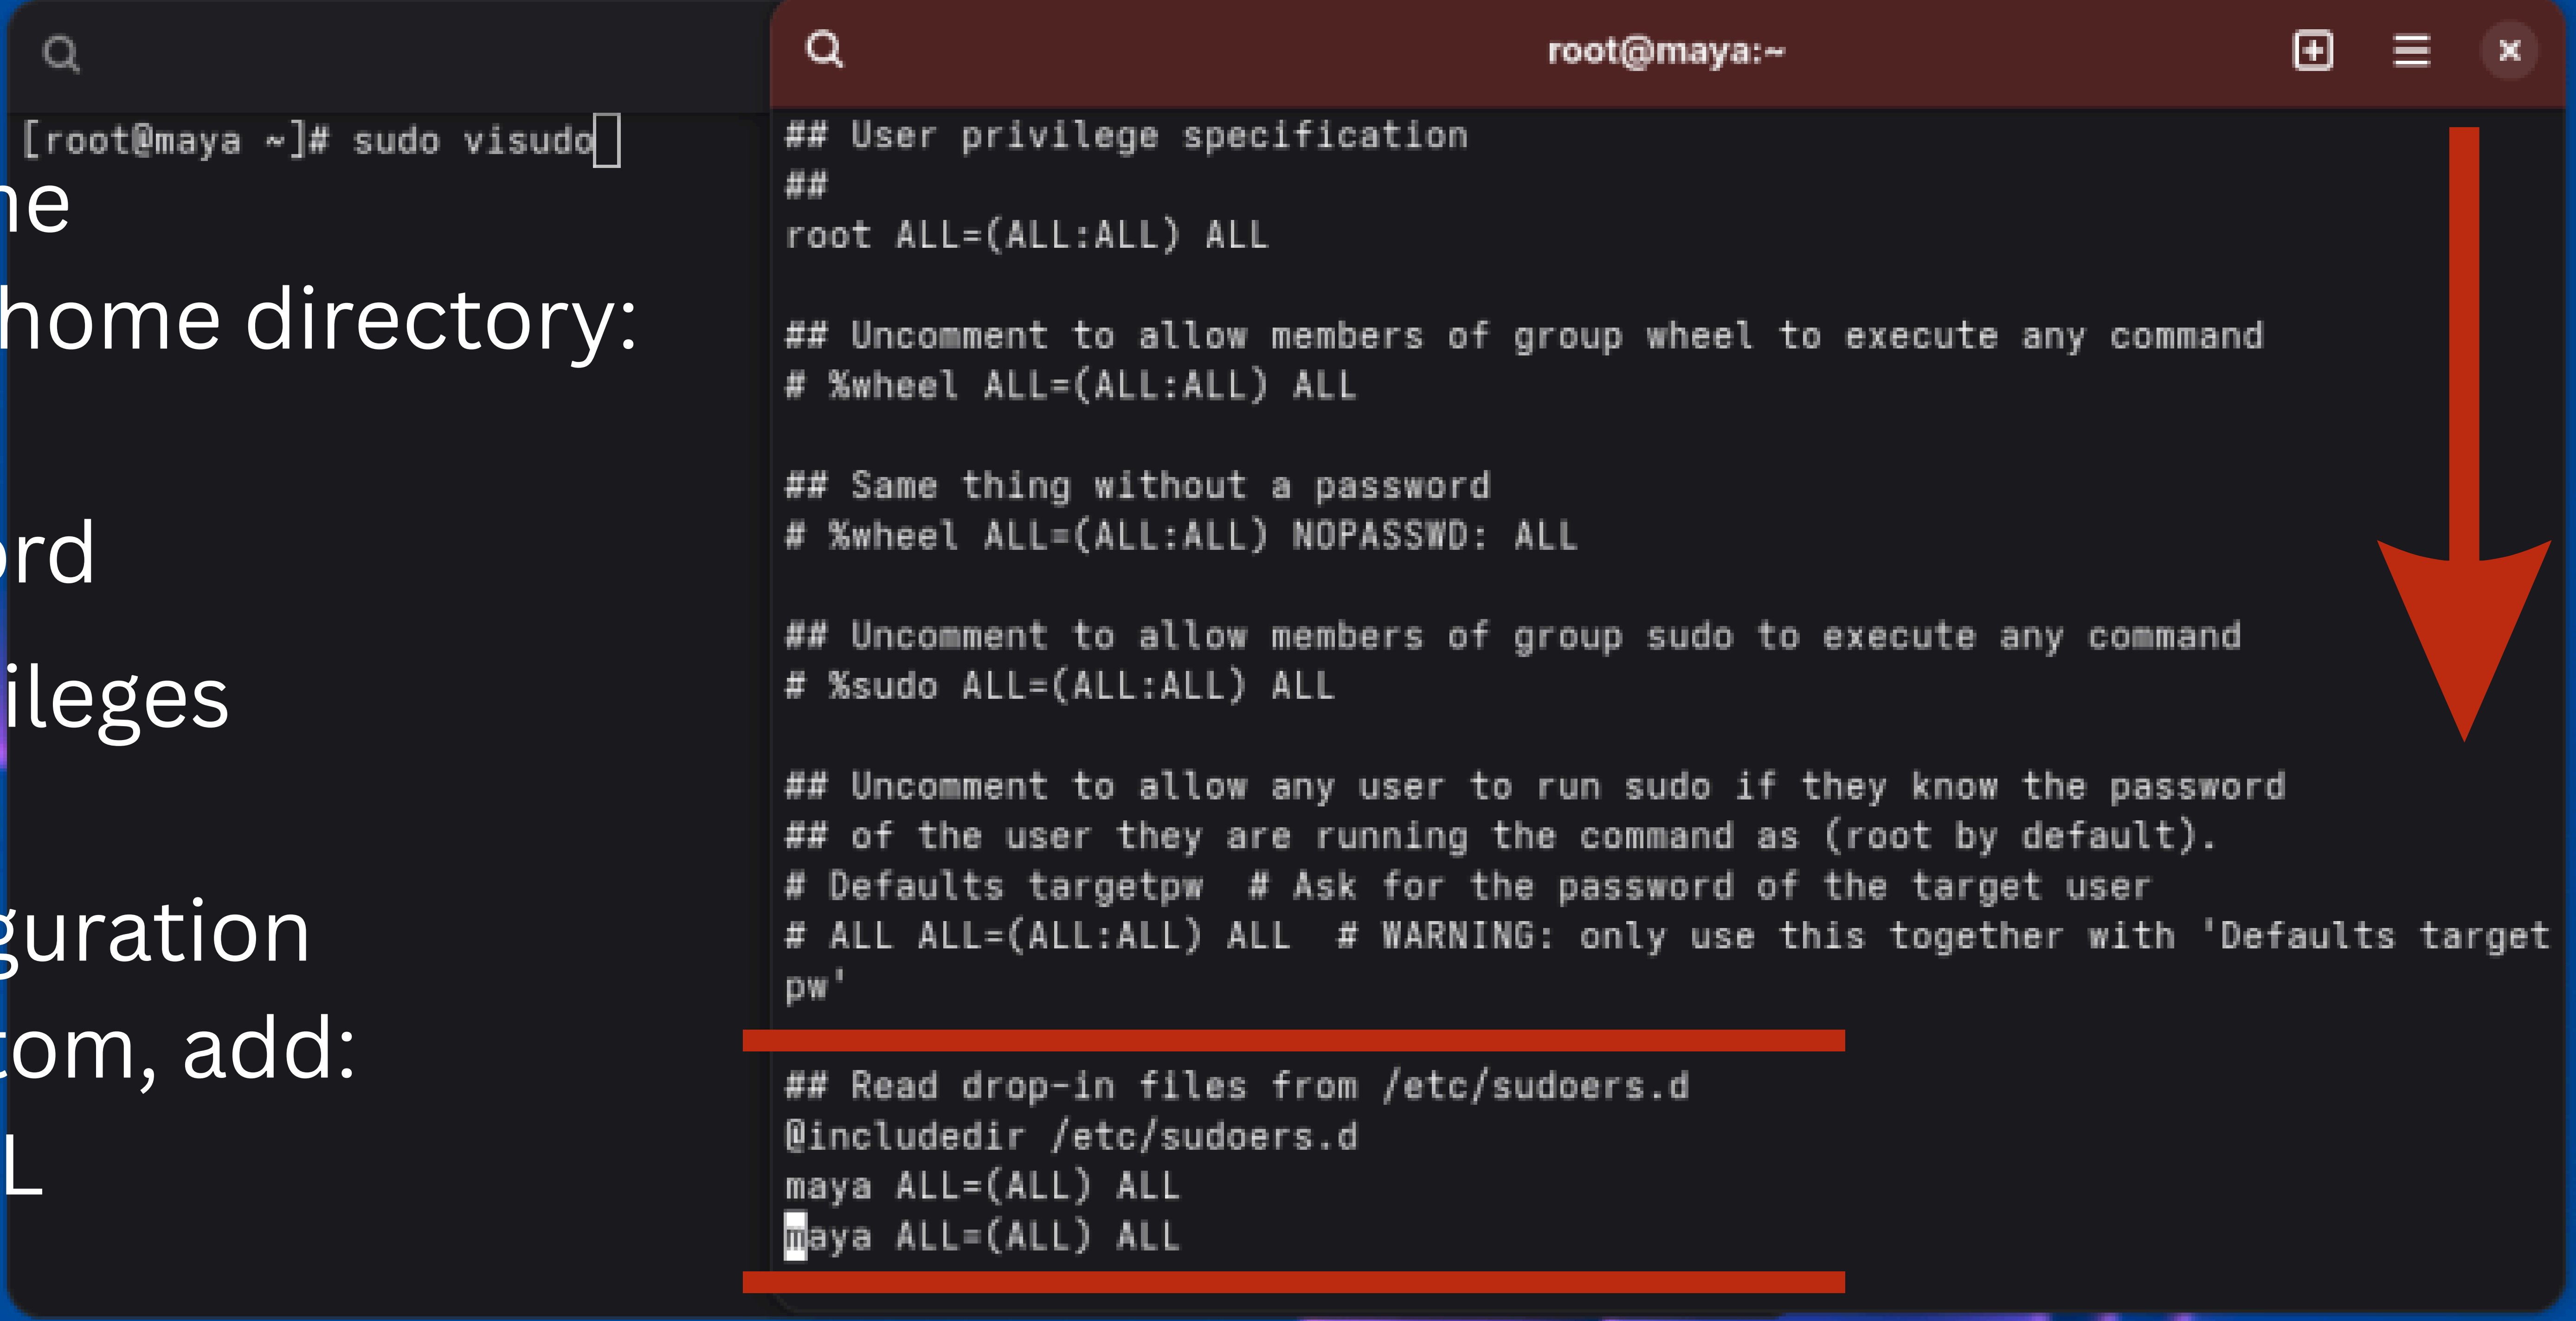
username ALL=(ALL) ALL

Save and exit with

Esc

:wq

Enter



Test the new user

su - username

// Switch to the new user

sudo whoami

// Test sudo

You should get:

root

//If that works, your new user is correctly configured.
